

Gale Common Stage I

A section model built from wood, acrylic, and "ash" was constructed to demonstrate the layers of Gale Common and how the landscape developed over time.

Starting with the site ground conditions, the topography levels begin to be constructed. "Ash" or black gravel here, was pumped to the site starting Stage I of Gale Common.

Stage I of the Gale Common site is now complete and a layer of ash has been added to construct the foundation of the site.

Gale Common Stage II

The section model develops a new layer in Stage II, as more ash is brought to the site and the hill increases in elevation.

More ash is pumped to the site causing an increase in elevation. The topography layers start to shift and grow as the site increases in structure levels.

Stage II is now complete with the topography layers and ash built up on the hill at Gale Common. The site will continue to change as more ash is also added to the site.
