

## Gale Common Stage III

Figure 1

Stage III has now been constructed as more layers of ash have been added to the site. The topography has shifted slightly and the site is taller in elevation than our before.

Figure 2

In Figure 2 a section view of the ash can be seen through the acrylic panel. Now the layers of the previous Stage I & II can be clearly seen as well. The ash has become the foundation for the site as it continues to grow being used for storage.

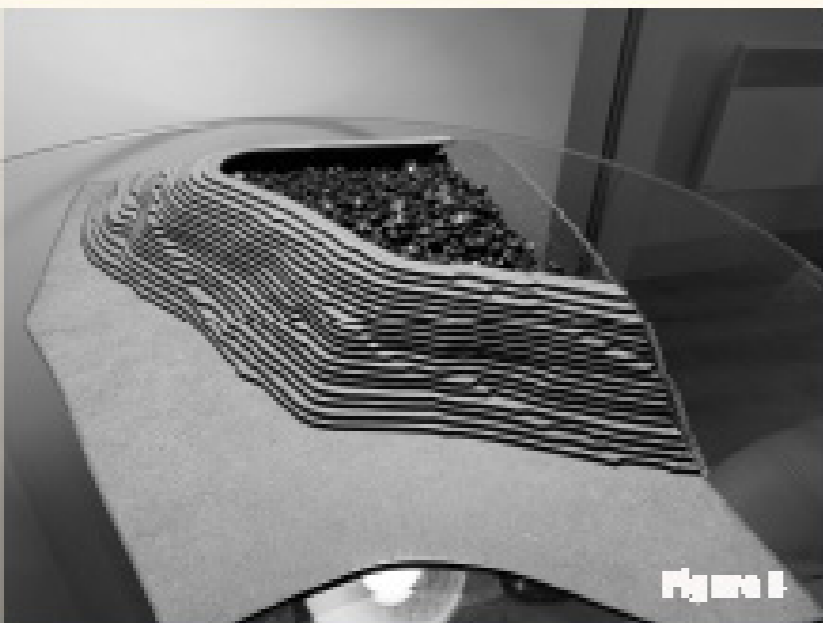

Figure 3

Stage III is complete with the ash layers of the site fully constructed. This image shows the development of Gale Common in section until Stage III.

## Gale Common Stage IV

Figure 4

Stage IV is the completion of the site. The last layers of the site are being constructed in these images as ash fill is the top layer of the contour model.

Figure 5

Ash is being added to the site as the model is repurposed in Stage IV. Figure 5 shows the model through the acrylic lens to see the built up foundation of the site.

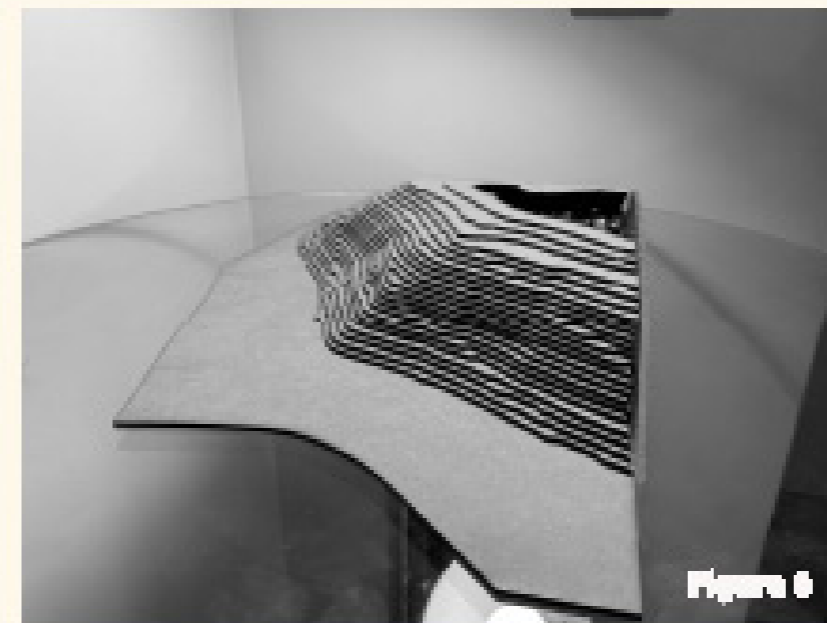

Figure 6

Completion of the Gale Common Site until Stage IV is demonstrated here. The landscape model shows each layer of the constructed stages as the ash was added to the site at Gale Common.
